

Anglian Water's fundamental goal is to deliver a reliable supply of clean, safe drinking water and effective wastewater services at an affordable price.

Geographically the largest water company in the UK, covering over 27,500 square kilometres, which is around a fifth of England and Wales, we provide more than 4 million customers with over one billion litres of high-quality drinking water every day and around 5.6 million customers benefit from our wastewater services.

The company aspiration is to become a frontier company within the industry and leading in terms of managing demand in one of the country's fastest growing region. It also wants to be recognised for its lead to understanding the potential impacts of climate change within the region moving forward.

Beovax Computer Services work closely with Anglian Water to develop bespoke IT systems which help the company to achieve their goals. These systems include:

- **Visual Intelligence System**– A corporate geographical information system for use in the operational management centre
- **Asset Management System** – Asset risk modeling solution for use in asset management investment planning.
- **Meter Exchange** – An enhancement to the meter reading system to collect meter exchange details.
- **Income and Billing System** – A database and reporting system to assist with new connections and debt recovery.
- **Waste Water Tracking System** - A system to track and maintain progress during the process of laying waste water mains.

"Beovax are strategic framework partners who provide software development services to Anglian Water. The Beovax team have worked closely with us over the years and have met our requirements on all projects, which have been completed on time and within budget."
